Video 3: The Negative One Trick with Simplifying

In its current form, can you simplify: $\frac{x-3}{3-x}$? Why or why not?

Show how you can manipulate this expression to simplify it.

There is no formal name for this trick. Some might refer to it as a *multiplicative property of -1*, but I refer to as “that -1 trick.” I know, it’s not exactly formal sounding!

Let’s do one more example of this. Simplify $\frac{5-x}{3x-15}$

The first thing to get used to it how to rewrite expressions using this trick.

Examples

Rewrite the order of each expression by factoring out -1 first.

a. $4 - x$

b. $3x - 1$

c. $x - 6$

Now let's use this to simplify rational expressions.

Examples Simplify the following.

a. $\frac{6x-12}{2-x}$

Examples Simplify the following.

b. $\frac{4x-20}{30x-6x^2}$

c. $\frac{x^2-4}{2-x}$

d. $\frac{x-6}{36-x^2}$

e. $\frac{5-x}{x^2-7x+10}$

Examples Simplify the following.

f. $\frac{x^2-10x+25}{25-x^2}$

g. $\frac{27-x^3}{x^2-5x+6}$

h. $\frac{x^3-3x^2+5x-15}{6-3x}$

Examples Simplify the following.

i. $\frac{54-9x}{x^2-36}$

j. $\frac{8-x^3}{x^2-9x+14}$

k. $\frac{y^3-x^3}{x^2-y^2}$

Example/Question: Troubleshooting the -1 Trick

Explain the actual DETAIL behind WHY $\frac{4}{5-x} = -\frac{4}{x-5}$

Examples Write an equivalent fraction for the following:

a. $\frac{5}{x-8}$

b. $\frac{x-3}{x+2}$

Lesson: Multiplying Rational Expressions

How do you multiply the fractions $\frac{a}{b} \times \frac{c}{d}$? Include a one-sentence explanation.

Examples Multiply the following.

a. $\frac{4}{5} \times \frac{7}{9}$

b. $\frac{2x^3}{7y^2} \times \frac{5x^5}{9y^7}$

Show how to make cancellations before multiplying $\frac{12}{25} \times \frac{15}{16}$

We can apply this same logic to rational expressions.

Examples Multiply the following and simplify when possible.

a. $\frac{21x^7}{15y^3} \times \frac{5y^8}{42x^4}$

b. $\frac{2x^2+5x+3}{x^2-25} \times \frac{x^3+125}{4x^2+6x}$

Lesson: Dividing Rational Expressions

How do you divide $\frac{a}{b} \div \frac{c}{d}$? Write a one sentence explanation of how to do this too.

Example Divide the following: $\frac{5x}{9} \div \frac{2}{7x^4}$

When can you make cancellations in the process?

Examples Divide.

a. $\frac{12x^7}{45} \div \frac{42x^3}{15}$

c. $\frac{x^3+1}{6x^3-6x^2+6x} \div \frac{x^2-1}{8}$

Explain why $\frac{\frac{5x+5y}{24}}{\frac{15x^2+15xy}{12}}$ is both a fraction and a division problem.

Example Divide: $\frac{\frac{16x^2-25}{x^5}}{\frac{36x-45}{9x^7}}$

Lesson: Finding the Least Common Denominator for Addition and Subtraction – A Quick Review for Fractions (with only numbers)

We are going to work on adding and subtracting rational expressions with different denominators. Before we do that, we are going to remind ourselves how to find common denominators for fractions that only have numbers.

The simplest case: what is the least common denominator between the fractions $\frac{1}{2}$ and $\frac{1}{3}$?

Why is that the common denominator?

Now let's look at something slightly more complicated. What is the least common denominator between $\frac{1}{6}$ and $\frac{1}{10}$?

First, take a guess. It's totally fine if this guess is wrong, but just make a guess.

Why is this your guess? What did you do?

There is a specific procedure that you want to use when finding least common denominators in this class. Write down instructions that were given in the video, but write them out in a way that makes sense to you.

Repeat this procedure to find the least common denominator $\frac{1}{15}$ and $\frac{1}{10}$.

Repeat this procedure to find the least common denominator $\frac{1}{12}$ and $\frac{1}{8}$.

Now we will focus on how to write fractions with this desired denominator.

The simplest case: using the least common denominator you found for $\frac{1}{2}$ and $\frac{1}{3}$, show how to write 2 equivalent fractions with the desired denominator. Write out instructions on how you do this. Summarize what was discussed in the explanation in the video.

Lesson: Three Ways to Use the LCD with Rational Expressions

We have spent quite a bit of learning how to find the LCD between rational expressions and then using it in very different ways. We are going to compare the 3 techniques for how we used the LCD in this video.

First, simplify completely:

$$\frac{9}{x+5} - \frac{4}{x+1}$$

Before we begin, should x have a solution? Why or why not?

Now show your work below.

What type of problem is this? How did we leverage the LCD in this case?

Simplify completely:

$$\frac{\frac{9}{x+5} - \frac{4}{x+1}}{\frac{10}{x^2+6x+5} - \frac{3}{x+1}}$$

Before we begin, should x have a solution? Why or why not?

Now show your work below.

What type of problem is this? How did we leverage the LCD in this case?

Solve:

$$\frac{9}{x+5} - \frac{4}{x+1} = \frac{10}{x^2 + 6x + 5}$$

Before we begin, should x have a solution? Why or why not?

Now show your work below.

What type of problem is this? How did we leverage the LCD in this case?

Example/Question: When Can You Cross Multiply

Explain what a ratio is:

When can you cross-multiply?

Solve: $\frac{8}{x+2} - \frac{12}{x-4} = \frac{2}{x+2}$. Show that you CANNOT cross-multiply in this situation.

Now show why cross-multiplying works with $-\frac{x}{5} = \frac{3}{x+8}$

Rational Expression Applications
Video 1: Proportion Type Problems

What is a proportion?

A bakery can make 300 cookies in 1.5 hours. How long would it take to make 525 cookies?

The ratio of patrons at a café who purchase coffee versus those who purchase tea is 5 to 3. On Monday, the café sold 45 teas. How many coffees were sold?

Video 2: Distance, Rate, and Time Problems

In these types of problems, we need to use the equation:

$$d = rt$$

Where d=distance, r=rate/speed of a vehicle, and t=time

We can also see that we can rearrange this formula in a few ways:

A boat travels 30 miles downstream in the same time that it takes to travel 20 miles upstream. The current of the river is 5mph. How fast would the boat travel in still water?

A boat travels 16 miles downstream in the same time that it travels 12 miles upstream. In still water, the boat can travel 6mph. What is the speed of the current?

A plane travels 550 miles with the wind. In the same amount of time, it travels 375 miles against the wind. If the wind is blowing at a speed of 25 mph, what is the speed of the plane when there is no wind?

Rational Expression Applications

Video 3: Work Problems

What is the setup for work problems?

It takes Maria 3 hours to paint a room, while it takes her younger sister Lupe 5 hours to paint the same room. How long would it take if the girls painted the room together?

It takes Max 30 minutes to shovel the driveway, while it takes his brother Darrell 45 minutes to do the same job. How long would it take for the guys to do it together?

Variation

Video Notes

The term “variation” refers to a particular way of describing how certain things relate to one another.

There are three types of variation we will look at. Write down the definitions for each, you will remember it better!

1. Direct Variation:

2. Inverse Variation

3. Joint Variation

It’s also possible to combine different types of variation.

The first thing we have to do is learn how to interpret and write variation equations.

Examples Write the variation equation:

- a. P varies directly with Q

- b. J varies inversely with L

- c. H varies jointly with A and B

- d. Z varies inversely with the square of R

- e. M varies directly as the square root of N

- f. Y varies jointly with the cube of M and the square root of L

- g. M varies directly as L and inversely as N

Now we can take a look at how to solve general variation equations.

Example Write down the detailed steps / directions for this example.

J varies directly with L. If $J = 12$ when $L = 4$, find J when $L = 7$.

Step 1:

Step 2:

Step 3:

Step 4:

Step 5:

Examples Using the steps outlined from the previous example, try the following:

- a. M varies inversely as the square of L . If $M = 12$ when $L = 2$, find M when $L = 4$.
- b. A varies jointly with B and C . If $A = 30$ when $B = 2$ and $C = 5$, find A when $B = 3$ and $C = 4$.
- c. L varies directly as M and inversely as N . If $L = 15$ when $M = 5$ and $N = 2$, find L when $M = 7$ and $N = 3$.

Example Jada's weekly income varies directly with the amount of hours that she works. Last week, she earned \$570 for working 38 hours. This week she worked 36 hours, how much will she earn?

Absolute Value Equations

Video 1: The Basics

Absolute value equations look like this:

$$|x + 2| = 7 \quad \text{or} \quad |3x - 5| + 4 = 2$$

To understand how to solve these types of equations, first think about: what are the solutions to $|x| = 5$? Explain why.

From here, we can see that we must consider 2 possible solution sets to find all solutions to absolute value equations. Write down the general strategy for solving absolute value equations:

Solve: $|2x + 3| = 9$

Examples Solve the following:

a. $|3x - 9| = 6$

b. $|7 - 4x| = 3$

To solve $|5x - 4| + 2 = 13$, what must we do first?

Solve:

Examples Solve:

a. $|3x - 6| + 4 = 10$

b. $\left|\frac{1}{2}x + \frac{1}{3}\right| + 5 = 10$

The next video will discuss a special situation and a more complicated equation type.

Absolute Value Equations

Video 2: More Complicated Situations

In this video, we will discuss how to solve equations like:

$$|x + 2| = -7 \quad \text{or} \quad |3x - 5| = |2x + 7|$$

What can we say about the solutions to $|x| = -5$?

Examples Solve the following:

a. $|2x - 7| = -8$

Example/Question: Why Do You Only Make One Side Negative with Solving $|ax + c| = |bx + d|$ type problems?

What is the approach for solving $|x + 1| = 5$?

Simplifying Radicals

The Basics

We will look at how to simplify radicals like this:

$$\sqrt{50} = 5\sqrt{2} \quad \text{or} \quad \sqrt[3]{250} = 5\sqrt[3]{2}$$

You might want to have the list of squares / cubes / quartics ready for this exercise. If you don't, pause the video and write them all down on a separate sheet of paper so that you can have it handy for this entire lesson.

First we look at **the multiplication property of radicals**:

Examples Multiply the following:

a. $\sqrt[3]{2} * \sqrt[3]{3}$

b. $\sqrt{7} * \sqrt{5}$

c. $\sqrt[3]{3} * \sqrt[3]{9}$

d. $\sqrt[3]{6} * \sqrt[3]{9}$

How are examples c and d related?

Being able to multiply radicals together is powerful, because it also allows us to break apart radicals and simplify them. Using the example $\sqrt{12}$, write down how to simplify:

Examples Simplify the following:

a. $\sqrt{50}$

b. $\sqrt{20}$

c. $\sqrt[3]{54}$

d. $\sqrt[4]{32}$

e. $\sqrt[3]{24}$

At this point, we should probably define when a radical is actually simplified.

Dividing Radicals/Rationalizing the Denominator

Part 2: Higher Roots

In this video we will look at how to simplify expressions like:

$$\frac{5}{\sqrt[3]{3}} \quad \text{or} \quad \frac{\sqrt[4]{2}}{\sqrt[4]{9}}$$

Before you begin, you should already be able to simplify problems like this:

a. $\frac{5}{\sqrt{3}}$

b. $\frac{\sqrt{6}}{\sqrt{18}}$

First, let's observe why higher roots are a different situation. Write down what happens if we use the same methods as above to rationalize the following: $\frac{5}{\sqrt[3]{3}}$

We have to pivot our thinking to "count powers". Note how this works with this examples: $\sqrt[3]{3} * \underline{\hspace{1cm}} = 3$

Examples Determine what to fill in the blank to create a true statement:

a. $\sqrt[3]{25} * ? = 5$

e. $\sqrt[3]{7} * ? = 7$

b. $\sqrt[4]{2} * ? = 2$

f. $\sqrt[4]{25} * ? = 5$

c. $\sqrt[4]{27} * ? = 3$

g. $\sqrt[5]{3} * ? = 3$

d. $\sqrt[5]{4} * ? = 2$

h. $\sqrt[3]{36} * ? = 6$

Now you should have a sense of what number you want this to equal. This is a very strange exercise, but using the pattern above, determine what to multiply by to get to the desired root:

a. $\sqrt[3]{4} * ? =$

c. $\sqrt[5]{9} * ? =$

b. $\sqrt[4]{5} * ? =$

d. $\sqrt[4]{36} * ? =$

Lesson: Determining if Functions are One-to-One

Before we begin, you should already be familiar with the concept of functions and the vertical line test. First let's do some review.

Review Determine whether the following relations are functions, then determine the domain and range.

a. $\{(2, 3), (5, 7), (2, 4)\}$

b.

Now we will discuss a specific type of function: a one-to-one function. Define this below:

How can we visualize this?

Example Determine if any of the following are i) functions and ii) one-to-one functions

a. $\{(2, 4), (-1, 7), (3, 7)\}$

b. $\{(3, 6), (-1, 2), (-3, -4)\}$

Similar to how we have a test to determine if a graph represents a function, we have another test to determine if a function is one-to-one.

Describe the horizontal line test below:

Examples Determine whether the following graphs represent i) functions and ii) one-to-one functions (draw your own):

a.

b.

c.

Lesson: Finding the Inverse of Functions

b. $g(x) = -\frac{1}{2}x + 4$

What is the relationship of a graph with its inverse?

a. $h(x) = \sqrt[3]{x}$

b. $f(x) = x^2, x \geq 0$

Lesson: Exponential Functions

An exponential function is a function of the form _____ where $a > 0, a \neq 1$.

Examples Graph the following functions, then determine their domain and range.

a. $f(x) = 2^x$

b. $g(x) = \left(\frac{1}{2}\right)^x$

Using the graphs above, summarize some of the characteristics of these graphs:

The number e is an irrational number that is frequently used in math. What is an approximation of e ?

Example Graph $f(x) = 2^x$, $g(x) = e^x$, $h(x) = 3^x$ all on the same graph below for comparison:

Translations work similarly to other graphs we have discussed. Using the graph of $f(x) = 2^x$ as a “base graph”, draw the following graphs together on the same graph: $f(x) = 2^x$, $g(x) = 2^x + 3$, $h(x) = 2^{x-1}$

Lesson: Solving Exponential Equations

In this lesson, we will solve equations that look like this:

$$3^x = 27 \quad \text{or} \quad 4^{x+3} = 8^{x-2}$$

To do this, we will write directions around the following example: $2^{3x} = 8^{x+1}$

Examples Solve:

a. $49^{x-3} = 7^{2x}$

b. $9^{4x} = 27^{x+4}$

Examples Solve:

a. $5^{x-2} = \frac{1}{25}$

b. $\left(\frac{3}{5}\right)^{2x} = \left(\frac{27}{125}\right)^{x+2}$

c. $27^{3x+1} = 9^{4x+2}$

Lesson: Intro to Logarithmic Functions

First, we want to review how to function inverses of functions. Find the inverse of: $f(x) = 2x + 8$

Graph the exponential function $f(x) = 3^x$ below:

Recall the exponential functions are one-to-one, which means that they have inverses. Attempt to find the inverse of $f(x) = 3^x$ below:

As we can see, there is an issue with finding the inverse – we have no way to solve for y ! As such, we need new mathematics to help solve this.

Write down the definition of a logarithm:

Examples Write the following in exponential form:

a. $\log_3 81 = 4$

c. $\log_5 125 = 3$

b. $\log_2 \frac{1}{8} = -3$

a. $2^4 = 16$

c. $6^{-2} = \frac{1}{36}$

b. $3^0 = 1$

d. $8^{\frac{1}{3}} = 2$

Now we can finally determine what is the inverse of $f(x) = 3^x$:

There are a few common logarithms:

- $\log x$ means:

- $\ln x$ means:

There are also 2 key properties of logarithms:

1. $\log_a a = 1$: explain why this makes sense

2. $\log_a 1 = 0$: explain why this makes sense:

Lesson: Basics of Solving Logarithmic Equations and Evaluating Logarithms

We want to solve equations that look like:

Example Solve: $\log_x 16 = 4$

Example Solve:

a. $\log_9 x = 2$

b. $\log_6(2x + 4) = 2$

Now we can also discuss how to evaluate logarithms. Explain how to evaluate: $\log_3 27$:

Examples Evaluate:

a. $\log_5 \frac{1}{25}$

b. $\log 100$

Examples Evaluate:

a. $\ln e$

c. $\log_{25} 5$

b. $\log_3 27$

d. $\log \frac{1}{10}$

Lesson: How to Graph a Logarithm

a. Convert to logarithmic form: $25 = 5^2$

Now we can explain how to graph $y = \log_3 x$

For comparison, also graph $f(x) = 3^x$ on the same graph above.

Example Graph $y = \log_{\frac{1}{2}} x$ below:

A Review of Fractions

Part 3: Advanced Fraction Operations with Multiplying, Dividing, Adding, and Subtracting

Before we begin this video, let's review what we discussed in the last video. If you can't do these and did not watch part 1, you should go back and work through that video first!

a. $3\frac{1}{5} - \frac{2}{5}$

b. $\frac{4}{7} \div \frac{3}{5}$

c. $5 \times \frac{2}{7}$

d. $4 \div \frac{3}{5}$

Now we will focus on some more complicated types of fraction problems. First we will focus on multiplication and division.

Using the example: $\frac{44}{70} \times \frac{35}{66}$, show how you can simplify this problem *before* you multiply.

With division problems, what must you do first *before you simplify*?

Using the example $\frac{66}{70} \div \frac{33}{49}$, show how to simplify this problem to make it easier to evaluate.

Evaluate the following. Simplify where possible.

a. $\frac{14}{25} \times \frac{15}{28}$

b. $\frac{15}{18} \div \frac{20}{24}$

c. $14 \times \frac{2}{21}$

d. $2\frac{1}{6} \div 4\frac{1}{2}$

Now let's focus on fractions that do not have a common denominator.

Explain how to get a common denominator when adding: $4 + \frac{2}{3}$

Get a common denominator to add the following. You do not need to simplify the improper fraction.

a. $5 - \frac{2}{7}$

b. $6 + \frac{3}{4}$

Now we will discuss a general strategy for how to add fractions with two different denominators. What is the goal when determining the common denominator between 2 fractions?

If you find the wrong denominator, that is okay on the ALEKS exam as long as you simplify your final answer. The worst that happens is that you've created a few extra steps of work for yourself.

Find the common denominator between the following pairs of fractions. Also write out your reasoning – it is important to write this out so that you don't forget!

a. $\frac{1}{6}, \frac{1}{10}$

b. $\frac{1}{14}, \frac{1}{21}$

c. $\frac{1}{24}, \frac{1}{36}$

d. $\frac{1}{50}, \frac{1}{35}$

Now that we have a general strategy to find a common denominator, let's discuss how to actually use that to write 2 equivalent fractions with a common denominator.

Show how we can rewrite $\frac{1}{2} + \frac{1}{3}$ with a common denominator.

Show how we can rewrite $\frac{5}{12} + \frac{3}{20}$ with a common denominator.

Can you simplify *before* you add or subtract two fractions? Draw a stick figure yelling this response at you – you are more likely to remember this important fact 😊

Add or subtract the following. Simplify any improper fraction as a mixed number.

a. $\frac{5}{12} - \frac{3}{16}$

b. $\frac{7}{24} - \frac{5}{16}$

A Review of Fractions

Part 3 - More Practice Problems!

a. $\frac{15}{36} \times \frac{27}{35}$

d. $\frac{21}{24} \div \frac{49}{50}$

h. $\frac{18}{30} \div \frac{21}{35}$

Add or subtract. Your final answer should be simplified. Convert improper fractions to mixed numbers for your final answer.

a. $4 - \frac{5}{6}$

f. $\frac{5}{24} - \frac{5}{16}$

A Review of Solving Linear Equations for the ALEKS Exam

What are like terms?

Which of the following are like terms?

$2x$ $5y$ 7 $8x$ 2 $-4x$ $7y$ $8z$

What is the most basic strategy for solving many types of linear equations?

Solve the following linear equations:

$$3x - 9 = 6$$

$$4x - 7 = 13 - 6x$$

Solve the following:

$$4(x + 5) - 1 = 3(x + 2) - 2(2x + 4)$$

Below are 2 unusual results that can occur with linear equations. Show how to interpret the unusual results.

$$3(x + 2) + 1 = 3x + 7$$

$$5(2x - 4) + 2x = 6(2x + 2)$$

Now let's discuss what to do when fractions or decimals are present in the equation.

First we will discuss how to clear decimals.

$$0.02x + 0.3 = 0.12 + 0.04x$$

$$0.04(2x - 4) + 0.05(x + 3) = 0.1(x - 4)$$

$$0.6(3x + 1) - 2(1 + 2x) = 0.6(3x - 1)$$

Now let's discuss how to clear fractions. To do this, you will need to know how to find the LCD between several fractions.

$$\frac{1}{15}x - \frac{1}{2} = \frac{1}{5}x - \frac{3}{10}$$

$$\frac{2}{3}(3x - 5) + 1 = \frac{3}{2}(x - 2) + \frac{1}{6}x$$

$$\frac{5}{6} - \frac{3}{4}(x + 2) = \frac{1}{2}x + \frac{7}{12}$$

A Review of Linear Inequalities

Sometimes ALEKS will ask you to graph an inequality. Let's review how to do that.

ALEKS uses open and closed dots on the number line. Some classes teach to use (or].

Graph $x \geq 3$. State your answer also in interval notation.

Graph $x < -5$. State your answer also in interval notation.

Graph $x \leq 0$. State your answer also in interval notation.

Graph $-2 \leq x < 4$. State your answer also in interval notation.

Solving linear inequalities works mostly similarly to solving equations, except for one catch. What do you have to watch out for when working with inequalities?

Solve the following linear inequalities. Graph your solution on the number line.

a. $3x > 12$

b. $-5x \leq 15$

c. $3x \leq -18$

d. $5 - 2x \geq 7$

Solve the following. You do NOT need to put your final answer on the number line.

a. $4x - 12 > 0$

b. $5 - x \leq 2$

c. $7x + 5 \leq 3x - 9$

d. $36 \geq 4x - 8$

Some of the situations that we discussed with linear equations can also happen with linear inequalities. This is a good moment to review some skills from the previous lesson. Solve the following. You do NOT need to put your final answer on the number line.

a. $2(x + 3) - (x - 1) > 8 - (x + 9)$

b. $\frac{1}{4}x - \frac{5}{2} \leq -\frac{1}{2}x - 1$

c. $6.1 \leq -0.55x + 6.1$

Finally, let's see what to do when there are multiple inequality signs. Solve the following:

a. $-4 \leq 2x < 8$

b. $6 \leq 4x - 2 < 14$

c. $-2 < 5x + 3 \leq 13$

d. $-3 \leq 5 - 2x < 9$

A Review of Linear Inequalities–More Practice!!!

d. $x \geq 1$

b. $x \geq -3$

e. $-3 \leq x \leq 6$

c. $x < -2$

f. $2 < x \leq 8$

Now solve the following. You do not need to graph your answers nor state in interval notation.

a. $4 - 6x \leq 16$

b. $3x + 1 > 5x - 9$

c. $-3 \leq 2x + 1 \leq 7$

Solve the following. You do not need to graph your answer this time.

a. $4x - (3x + 5) \leq x - 10$

b. $-\frac{5}{9}x + \frac{11}{12} < \frac{23}{36}$

c. $8.7x + 4.33 \leq -2.4x - 33.41$

d. $\frac{1}{2}(x - 3) + \frac{3}{4}x \leq \frac{1}{2}(2x + 3) + \frac{3}{8}$

e. $0.04x + 0.12(10 - x) < 8$

f. $2 < \frac{3}{4}x + 8 \leq 11$

A Review of Lines

Part 1: Graphing Lines and Working with Points and Intercepts

An equation of a line typically comes in one of three forms. Write them down:

Every line has a slope. What is a slope?

Graph a line that goes through the point $(-2, 3)$ with the given slopes:

Slope $m = \frac{1}{2}$

Slope $m = -3$

Graph a line that goes through the point $(0, -1)$ that has slope $m = -\frac{1}{2}$. Circle where the x- and y-intercept are.

The x-intercept is where the line crosses the x-axis. The y-intercept is where the line crosses the y-axis.

In the slope-intercept form and point-slope form of a line, it is easy to find in the slope. In each equation, note where the slope can be found.

$$y = mx + b$$

$$y - y_1 = m(x - x_1)$$

It is also obvious in each equation what point to use *if you recall how to read these equations*. Let's dissect each equation.

For $y = mx + b$, what is the other point you can use?

For each equation, state what the slope and y-intercept are of the equation. Then graph the line.

a. $y = -3x + 2$

b. $y = \frac{2}{3}x - 4$

For each equation, state what point and slope are being given in the equation. Then graph the line.

a. $y - 4 = 2(x + 1)$

b. $y + 1 = -\frac{1}{2}(x + 2)$

The trickier form of a line is the standard form $Ax + By = C$. If you need to figure out the slope or y-intercept from standard form, you can just solve the equation for y.

Put each equation into slope-intercept form. Then graph the line.

a. $4x - 2y = 6$

b. $3x + 2y = -9$

What is the general strategy for finding x- and y-intercepts if you aren't sure? Draw a picture to go along with this explanation.

Evaluate the following polynomials for $x = -2$

a. $x^2 + 5$

b. $3x^3 - 2x^2 + 5x + 1$

To add or subtract polynomials, you mainly just add like terms. If you are subtracting 2 polynomials, be careful with the negative sign!

a. $(3x^2 + 5x + 7) + (5x^2 - 2x - 3)$

b. $(5x^3 - 2x^2 + 5x + 1) - (4x^3 + 2x^2 - 7x - 3)$

c. $(5x^4 + 2x^3 - 2x^2 + 5x - 6) - (2x^3 + 2x - 8)$

a. $3x(4x^2 + 5x - 1)$

b. $5x^3(x^2 - 2x + 4)$

To multiply two polynomials together, we need to focus on multiplying every term in one polynomial by every term in the other polynomial. Show how to illustrate this with the following examples:

$$(3x + 1)(5x - 2)$$

$$(x^2 + 5x + 3)(2x - 4)$$

One last type of polynomial multiplication that we should discuss are ones of this form:

a. $(x - 3)^2$

b. $(2x + 1)^2$

c. $(x^2 + 3x - 1)^2$

A Review of Factoring

Part One: Basic Factoring Review

This is a very brief review of some of the main types of factoring. Factoring is a very large topic, and if you'd like to do an in-depth review of it then I have plenty of videos that do that. In this video, I'm going to review just the easier types.

First, let's talk about factoring out the greatest common factor (GCF).

What is the GCF of $3x + 3y$? Show how to factor this expression.

Factor the following using the GCF:

a. $5x + 10$

b. $5x^2 + 10x$

c. $25x^3y^2 - 15x^2y^3 + 35x^4y^4$

d. $16x^3y^7 + 8x^4y^5$

The next type of factoring we will discuss is grouping. Explain how grouping works with the example:

$$ax + ay + bx + by$$

Finish the grouping for these examples:

a. $3(x + y) - 5z(x + y)$

b. $4x(3x - 1) + (3x - 1)$

Use grouping to factoring the following:

a. $3x + 3y - 7xz - 7yz$

b. $5x^2 + 10x - 6x - 12$

c. $3x - 6xy - 7z + 14yz$

Finally, we will discuss factoring trinomials. We will utilize the trial and error method, and we will focus first on trinomials with a leading coefficient of 1 (if you have no idea what it means, basically we are focusing on the easier case for now).

Explain how to think about factoring: $x^2 + 3x + 2$

Factoring the following:

a. $x^2 + 5x + 6$

b. $x^2 - x - 12$

c. $x^2 + 7x + 12$

d. $x^2 - 2x - 15$

e. $-x^2 + 6x - 16$

One really common “trinomial” is called the difference of squares. Note the pattern to factor the following:

a. $x^2 - 9$

b. $x^2 - 25$

c. $x^2 - 1$

d. $x^2 + 4$

e. $x^2 - \frac{4}{9}$
